Listing of Claims:

1. (Currently Amended) A synchroniser for use in a receiver which receives signals, said synchroniser comprising:

means for providing a digital control signal, said control signal defining a plurality of different levels;

means for controlling the level provided by successive ones of said control signals, successive ones of said control signal defining different values;

means for converting said digital control signal into an analog control signal for controlling a mixing frequency; and

means for estimating the difference between the levels of successive ones of said <u>analog</u> control <u>signal</u> <u>signals</u>.

- 2. (Canceled)
- 3. (Currently Amended) A <u>The</u> synchroniser as claimed in of claim 1, wherein said providing means, said controlling means and said estimating means are in the digital domain.
- 4. (Currently Amended) A <u>The</u> synchroniser as claimed in of claim 3, wherein said providing means, said controlling means and said estimating means are provided in a digital signal processor.
- 5. (Currently Amended) A <u>The</u> synchroniser as claimed in of claim 1, wherein said providing means comprises a digital corrector.
- 6. (Currently Amended) A <u>The</u> synchroniser as claimed in <u>of</u> claim 1, wherein a rough correction is provided by said control signal.
- 7. (Currently Amended) A <u>The</u> synchroniser as claimed in <u>of</u> claim 6, wherein a rough correction is provided in an <u>analogue</u> <u>analog</u> domain.

- 8. (Currently Amended) A <u>The</u> synchroniser as claimed in of claim 6, wherein a finer correction is provided.
- 9. (Currently Amended) A <u>The</u> synchroniser as claimed in <u>of</u> claim 8, wherein said finer correction is provided in a digital domain.
- 10. (Currently Amended) A <u>The</u> synchroniser as claimed in <u>of</u> claim 1, wherein said means for estimating comprises an estimator arranged to determine that the difference between two successive levels has increased if a difference between the upper of said levels and an estimated level for an actual signal provides a signal at a higher level than a signal provided by a difference between a lower of said levels and an estimated level for the actual signal.
- 11. (Currently Amended) A <u>The</u> synchroniser as claimed in <u>of</u> claim 2 <u>1</u>, wherein said means for estimating comprises an estimator arranged to determine that the difference between two successive levels has increased if a difference between the upper of said levels and an estimated level for an actual signal provides a signal at a higher level than a signal provided by a difference between a lower of said levels and an estimated level for the actual signal.
- 12. (Currently Amended) A <u>The</u> synchroniser as claimed in of claim 1, wherein said means for estimating comprises an estimator arranged to determine that an actual signal has changed if a difference between the upper of said levels and an actual signal provides a signal at substantially the same level as a signal provided by a difference between a lower of said levels and the actual signal, said same level being different to a previous level for said actual signal.
- 13. (Currently Amended) A <u>The</u> synchroniser as claimed in <u>of</u> claim 1, wherein said synchroniser is arranged to at least one of acquire and track frequency error.
- 14. (Currently Amended) A <u>The</u> synchroniser as claimed in of claim 1, wherein said synchroniser is arranged to at least one of acquire and track timing error.

15. (Currently Amended) A <u>The</u> receiver comprising a <u>the</u> synchroniser as claimed in claim 1.

16. (Canceled)

- 17. (Currently Amended) A <u>The</u> synchroniser as claimed in of claim 2 1, wherein said providing means, said controlling means and said estimating means are in the digital domain.
- 18. (Currently Amended) A <u>The</u> synchroniser as claimed in <u>of</u> claim 7, wherein a finer correction is provided.
 - 19. (Currently Amended) A <u>The</u> receiver as elaimed in of claim 15, further comprising: an antenna for receiving signals;
 - a first bandpass filter for filtering out unwanted signals;
 - a mixer for downconverting received signals to a baseband frequency;
 - a second bandpass filter for removing unwanted signals falling outside the bandwith of said second bandpass filter;
 - an analogue analog to digital converter for converting signals received from said second bandpass filter from analogue analog to digital form; and
 - a digital to <u>analogue</u> <u>analog</u> converter for converting the signals received from said digital signal processor from digital to <u>analogue</u> analog form.
- 20. (Currently Amended) A <u>The</u> receiver as claimed in of claim 19, wherein said synchroniser includes a digital signal processor comprising:
 - a detector for measuring frequency errors and sending a digital word;
 - a filter for filtering said digital word output by said detector;
 - a step size estimator for estimating an actual step size of a frequency change provided by said digital to analogue analog converter and providing said actual step size to analogue analog correction; and
 - a digital automatic frequency control unit for controlling division of correction between analogue analog and digital parts, performing an accurate

correction so that a zero or close to zero error is achieved and compensating for the effect of an analogue analog control for which a step size is estimated while a control word is changed[[;]].

21. (Currently Amended) A method for providing synchronization in a receiver, comprising the steps of:

providing a digital control signal, said control signal defining a plurality of different levels;

controlling the level provided by successive ones of said control signals, successive ones of said control signal defining different values;

converting the digital control signal into an analog control signal for controlling a mixing frequency; and

estimating the difference between the levels of successive ones of said analog control signal signals.
